You have a set of integers  $s$ , which originally contains all the numbers from  $1$  to  $n$ . Unfortunately, due to some error, one of the numbers in  $s$  got duplicated to another number in the set, which results in **repetition of one** number and **loss of another** number.

You are given an integer array `nums` representing the data status of this set after the error.

Find the number that occurs twice and the number that is missing and return *them in the form of an array*.

Example 1:

Input: `nums = [1,2,2,4]`

Output: `[2,3]`

Example 2:

Input: `nums = [1,1]`

Output: `[1,2]`

Constraints:

- $2 \leq \text{nums.length} \leq 10^4$
- $1 \leq \text{nums}[i] \leq 10^4$
